1.0 Loader Terminology
The loader is designed as a truck mounted loader and therefore stationary mounting of the loader, mounting on agricultural tractors, special purpose vehicles and the like may only be performed according to specific agreement with IMT.

1. Suspension traverse
2. Control valve, loader
3. Stabilizer beam
4. Extension cylinder
5. Stabilizer leg
6. Control valve, stabilizers
7. Slewing cylinder
8. Planetary gear
9. Boom cylinder
10. Base
11. Column
12. Link arm, boom
13. Hinge pin
14. Main boom
15. Jib cylinder
16. Jib pin
17. Link arm, jib
18. Jib
19. Extension
20. Extension cylinder

2.0 General Safety Considerations

**WARNING**
Prior to operation, read and understand the IMT Operator’s Crane Safety manual and any other safety manuals which accompanied the loader.

**General Safety Considerations**
Prior to starting the loader, the operator must check the following factors:

1. Ground Stability - The ground must be stable enough to withstand the stabilizer leg pressure. Steel plates should be placed beneath the stabilizer foot plates to support heavy lifts.

2. Ground Surface Conditions - The ground must not be slippery (i.e., covered with ice, sand, etc.). When the parking brake is applied, the truck must not skid or move during horizontal pressure from the loader.

3. Visibility - The operator must have a complete and unobstructed view of the field of operation.

4. Overhead Powerlines - The operator must make sure that there are no electric wires or any other obstacles within the working radius of the loader.

5. Unauthorized Entry - The operator must inform any unauthorized persons that entry into the working area is not permitted.
General Rules for Powerlines or Power Supply Stations:
When working in proximity to power supply stations or overhead wires, follow these general rules:

1. Be careful in planning, instructing, and executing work to prevent any risk or danger to persons, equipment or goods.

2. Consider any power supply plant, installation or wire live until proven otherwise.

3. Follow any and all directions or guidelines from the responsible power supply authorities.

Any person or company directly responsible for the implementation of work in the proximity of overhead wires or electric power stations must make sure that all personnel involved in the execution of such work is familiar with any laws, rules or safety regulations.

FIGURE 2: DECAL - DANGER, ELECTROCUTION

Electrocution Hazard
Crane is not insulated
NEVER approach or contact power lines with any part of this equipment or load.
Keep 50 feet away from any power line if voltage is not known.
Keep 20 feet away from any power line 350 kilovolts or less.
Account for swaying motion of power line, equipment, and load line.
Follow OSHA 29CFR 1926.1400.
Death or serious injury will result from approaching or contacting a power line.

3.0 Loader Operation
3.1 Start-up Preparation
I. Switch the hydraulic change-over valve to the “loader” position.

II. Engage the PTO at low revolutions. The engine revolution speed is regulated via the hand accelerator to ensure that the oil flow from the hydraulic pump corresponds to the recommended pump flow for the loader. If starting the loader in cold weather, the oil should circulate for a few minutes before operation starts.

III. Apply the vehicle parking brake.

IV. RCL System - Prior to setting the stabilizers or starting loader operations, the RCL (rated-capacity limitation) system must be activated. To activate the RCL system, pull out the emergency stop button(s). Push the green button (Button # 3) once. The “RUN” diode on the RCL system control panel (Figure 3) is lit and the RCL safety system is activated.
3.2 Stabilizer Activation

I. To activate the stabilizer function, push the yellow button. The “FUNC” and “F5” diodes are lit. After 10 seconds the diodes are turned off, but the stabilizer function remains activated.

II. To set the stabilizers, release the stabilizer lock and extend the stabilizer beam completely. **LOCK IT AGAIN.** The stability of the vehicle and the loader is based on the stabilizer legs being fully deployed, and the loader should only be used when the stabilizers are fully deployed. The operator must make sure that the vehicle has sufficient stability in the area in front of the stabilizers (over the cab). The stabilizers should be lowered just enough to raise the truck chassis slightly, while keeping the tires in full contact with the ground.

When loading the truck, the operator must raise the stabilizer legs periodically to ensure that the truck and not the stabilizers carry the weight. The stabilizer legs are not designed to support a fully loaded truck.

III. Position the vehicle as close to horizontal as possible. Use the stabilizers if necessary to achieve horizontal positioning if the ground is not level.

IV. Use plates (steel) beneath the stabilizer legs if the ground cannot support the stabilizer leg pressure.

3.3 Unfolding the Loader

I. Extend stabilizer beams fully and engage swivel locks.

II. Lower the stabilizer legs.

III. Lower the outer boom slightly to release it from the bracket.

IV. Raise the inner (main) boom to release it from the bracket. Raise the inner (main) boom about 10° above horizontal so that the outer boom can be moved freely downwards.

V. Raise the outer boom (jib) until it is free from the base.

VI. If the loader is equipped with a stop bracket on the outer boom, extend the extension booms until the stop bracket is released.
3.4 Using the Loader

Loader Valve Bank Activation
To activate the loader working functions, move one of the control levers of the loader’s control valve OR push the yellow button twice. “FUNC” will be lit and “F5” will be turned off.

Now the loader functions can be operated using the control valves. Each control valve is labeled with the functions of that particular valve. Control levers should always be operated steadily and smoothly to avoid unnecessary strain on the loader.

- CS or Out
- Fly-Jib UP
- Jib Ext Out
- Winch Down

The lifting capacity of the loader is shown on the Capacity Chart on the loader and in this instruction manual. Never exceed the indicated capacity limits.

The loader is designed to lift loads vertically. Diagonal stress must be avoided. Do not drag loads across the ground using the extension cylinders or the rotation system. Activate these functions when the load is free of the ground.

When mounting a grapple, the total weight (grapple, rotator, and contents) must not exceed the lifting capacity of the loader at maximum reach. The grapple may be used to move soil only. It must not be used to excavate earth.

If the load is extended so far that the lifting capacity is exceeded, the load moment increasing movements will be stopped. See the RCL Safety System Instruction Manual.

WARNING

Never stand under the boom when the loader is working.

NOTES FOR SAFE OPERATION:
- Position the truck as closely to the load as possible to lift the load on the shortest possible boom.
- Operate the rotation system carefully, especially when the inner boom is at an acute angle to the outer boom.
- Do not activate the stabilizers when the loader is working.
- Never drive off with a suspended load.
3.5 Post Operation

To stow the loader, reverse the procedure in Section 3.3, *Unfolding the Loader*. If the boom is parked on the truck platform it must be properly secured to prevent the boom from swinging out during transport. The total height should not exceed 13'6" per Federal Highway Regulations.

If the loader is equipped with swing-style stabilizer legs, they must also be secured in position before driving off.

Before the vehicle is started, the PTO must be disengaged. This will turn off the pump.

4.0 Maintenance

Regularly check the items listed below. Log all inspections in the IMT Crane Log included with the manual.

1. Check the oil level in the tank and rotation system. Oil must be visible in the oil level glass of the tank when the loader is folded. If the loader is equipped with a planetary gear, check its oil level.

2. Check for defects, damage, or leaks. If found, take the loader to an authorized IMT service center for repair as soon as possible.

3. Check the integrity of the loader to truck mounting hardware.

4. Slide blocks and bushings reduce friction and therefore they are naturally subject to wear. Slide blocks should be replaced when slack is detected in the boom system. Bushings should be replaced before the metal components physically touch each other.

5. Check all hoses for defects and kinks.

6. Check that hooks, straps and safety latches are in good working order.

7. Check all lock pins and bolts for wear.

4.1 Lubrication Intervals

**Pinion of mast/Planetary gear (if any):**
after 50 hours of operation/1 month (whichever occurs first)

**Base bearings:**
after 20 hours of operation/1 week (whichever occurs first)

**Extension system/Slide blocks:**
after 50 hours of operation/1 month (whichever occurs first)

**Guide rail on extension cylinders:**
after 50 hours of operation/1 month (whichever occurs first)

**Pin connections/Bolts:**
after 50 hours of operation/1 month (whichever occurs first)

**Stabilizer beams:**
as required

**Control valves and rod connections (Oil spray):**
as required
4.2 Lubrication Chart

FIGURE 9: LOADER LUBRICATION POINTS

When lubricating the bearings in the base, activate the rotation system and swing the loader from stop to stop within the entire rotation area.

The telescopic extensions and planetary gear are lubricated with a special grease (Statoil Grease Way CaH or Castrol ALV).

CAUTION

If the loader is not folded after use, retract all cylinders at least once per day to avoid corrosion on the piston rod surface.

5.0 Lifting Capacity

5.1 Capacity Charts

The loader is marked with factory-installed lifting capacity decals. These decals must be intact and legible. If the decal has been damaged or removed, order a new decal from IMT using the part number from the decal or consult the parts manual, decal kit.

As a supplement to the loader’s lifting capacity decals, the following pages contain load and lifting capacities of the different K-versions in standard applications. Special applications and customized decals and options are not shown.

WARNING

Never exceed the lifting capacity limits.
Working loads will be limited to those shown. Deduct the weight of load handling devices.

Before lift is made, stability must be checked per SAE J765A.
Model 7/51K2

- Working loads will be limited to those shown. Deduct the weight of load handling devices.

*Crane rating (ft-lb) is the rated load (lb) times the respective distance (ft) from the centerline of rotation with all extensions retracted and the inner and outer booms in a horizontal position, per ANSI B30.22

**Crane weight does not include stabilizers.

***Centerline rotation to bridge.

### SPECIFICATIONS

- STABILIZER PAD DIAMETER: 6.3" (160 mm)
- CRANE STORAGE HEIGHT: 6'-7" (2 m)
- MOUNTING SPACE: 26.4" (670 mm)
  
  (Allow an additional 7" between the cab and the crane base for swing clearance.)
- ROTATIONAL TORQUE: 6,870 ft-lb (0.9 tm)
- ROTATION: 400 degrees
- OPTIMUM PUMP CAPACITY: 9 gpm (35 L/min)
- SYSTEM PRESSURE: 3,990 psi (275 bar)
- OIL RESERVOIR CAPACITY: 11.1 gal (42 L)
- STABILIZER EXTENSION SPAN
  
  STANDARD (Manual out, hydraulic down): 14'-9" (4.5 m)
  
  WEIGHT: 361 lb (164 kg)
  
  OPTION 1 (Manual out, hydraulic down): 18'-4" (5.6 m)
  
  WEIGHT: 540 lb (245 kg)

  (Option 1 recommended for rear mount applications.)

### MINIMUM CHASSIS SPECIFICATIONS

- FRONT AXLE RATING (GAWR): 7,000 lb
- REAR AXLE RATING (GAWR): 15,000 lb
- RESISTANCE TO BENDING MOMENT (RBM): 780,000 in-lb

### WORKING SPEEDS

- ROTATIONAL SPEED: 20 °/sec

### WEIGHTS

- MOUNTING BOLTS: 117 lb (53 kg)
- OIL IN BASE AND CYLINDERS: 82 lb (37 kg)
- STANDARD TANK WITH OIL: 123 lb (56 kg)
- CRANE WEIGHT, EXCLUDING STABILIZERS
  
  K1: 2050 lb (930 kg)
  
  K2: 2216 lb (1005 kg)
  
  K3: 2370 lb (1075 kg)
  
  K4: 2513 lb (1140 kg)

### POWER CONSUMPTION /PUMP PERFORMANCE

- WORKING PRESSURE: 4567 psi (31.5 MPa)
- POWER CONSUMPTION: 16 KW
- OIL CAPACITY IN BASE: 7.4 gal (28 l)
- OIL CAPACITY IN SEPARATE TANK: 11.1 gal (42 l)
**7.0 Working Pressure / Performance**

The working pressure should be set with a pressure gauge. Keep the pressure below the limits as shown in the following tables. Check the working pressure at least annually, and during any repair, following the procedures described in the IMT Crane Log manual. All adjustable valves must be resealed after pressure setting adjustment.

1 MPa = 10 bar
8.0 Hydraulic System

8.1 Description
The valve block of the loader is of the “stack” type, i.e., it is made up of a number of separate control valves. A main relief valve is fitted in the inlet section of the valve block to ensure that the oil pressure in the pump line does not exceed the permissible limit. This valve is adjustable and must always remain sealed.

Port relief valves are mounted at the ports of the individual control valves to limit the pressure in the individual circuits. The port relief valves are pre-set and not adjustable.

The inner, outer, and extension cylinders are mounted with load holding valves with the following functions:

1. Protect cylinders against excessive pressure.
2. Speed control when the boom is lowered.
3. To maintain the boom in position during operations where a fixed boom position is required.
4. To lock the boom and maintain the load in position in case of hose or pipe rupture.

The stabilizer cylinders are equipped with a piloted check valve that locks the cylinder in case of damage to the hydraulic system.

CAUTION
The main relief valve, the load holding valves, the dump valve and the external relief valve are sealed. Check these seals regularly and take the loader to an authorized IMT Service Center if the seals are damaged and require repair.

8.3 Hydraulic Diagrams
The following page contains the hydraulic diagram for the loader in standard application. There may be changes in design of the hydraulic system when applied to special and/or customized loaders. In these cases refer to the supplementary documentation.
9.0 Bleeding of Cylinders
If air has entered the hydraulic system, bleed the air from the loader.

1. Raise and lower each stabilizer leg twice.
2. Extend and retract the inner boom cylinder twice.
3. Extend and retract the outer cylinder twice with the inner boom pointing downward, and twice with the inner boom pointed upward.
4. Extend and retract the extension cylinder twice with the outer boom pointed almost vertically upward, and twice with the outer boom pointed almost vertically downward.

10.0 Repair
If defects, damage or leaks are found, repair them immediately. Always have your repairs performed by an authorized IMT service center. Repairs to the hydraulic system must be made only at an authorized service center.

When ordering parts for your loader, please state:
- Loader model (7/51)
- Loader serial number (found on serial number placard on loader)

11.0 Service

11.1 Initial Service Overhaul
The initial service overhaul is recommended after the first 20 hours of service or after one month of loader use, whichever comes first.

The service overhaul should include the following:

1. Change of return filter element and high pressure filter cartridge, if any.
2. The oil level in tank and rotation system. Oil must be visible between maximum and minimum lubrication on the oil level rod, when the loader is in the folded position. The oil level in the slewing system should also be visible in the inspection tube.
3. Overall lubrication according to the lubrication chart in this manual.
4. Leak check and tightening of fittings, if required.
5. Checking of working pressure and lead seals. The correct working pressures are stated in relevant Technical Information sheets.
6. Test of all functions under load.
7. Checking and, if required, tightening of mounting bolts and pin connections.
8. Checking of all lock bolts and pins.
11.2 Annual Service Overhaul
Each year the loader should be given a complete service overhaul at an authorized IMT service center. The service check must include:

1. Oil change for hydraulic oil in tank and rotation system.
2. Filter change for return filter element and high pressure filter cartridge.
3. Air filter cleaning or replacement.
4. Working pressure and valve lead seal check.
5. Idling pressure check.
6. Complete function test under load.
7. Check slide blocks and bearing bushings for wear. Replace if necessary.
8. Check hydraulic hoses.
9. Leak check and tighten all connections.
10. Check pump and transmission.
11. Check loader base to chassis mounting hardware.
12. Check all bolt connections. Tighten if required.
13. Check overall loader structure for damage. Any damage found should be repaired immediately.
14. Check bolts and lock plates.

12. Load Moment Limitation
The loader is equipped with a load moment limitation system (LMB). This system ensures that the permissible load moment is never exceeded, irrespective of the operator’s doings.

However, it is important to keep in mind that the LMB-system does not necessarily ensure sufficient vehicle stability. Before starting to work with the loader, the operator must always make sure that the vehicle is stable in the entire slewing area of the loader. However, if the loader is equipped with an EVS-system (Electronic Vehicle Stability), the stability of the vehicle is ensured in the entire working area, because the system is constantly checking the vehicle, and immediately stopping the load moment increasing movement in case of instability, irrespective of the operator’s doings.

Note
The RCL system is described in detail in the Instruction Manual - RCL Safety System. The loader operator should be familiar with the RCL system.

13. Heavy Duty Lifting - HDL
If the loader is equipped with a Heavy Duty Lifting (HDL) system, the loader can attain an increased lifting capacity at reduced speed.

When the loader reaches its normal lifting capacity limit, the HDL-system will automatically be activated and the oil flow to the control valve will be reduced to approximately 20 percent of the normal oil flow. At the same time, the loader lifting capacity is increased by approximately 10 percent in the entire working area of the loader. When the HDL-system is activated, the operator will be able to continue extending the load without interruption, although at reduced speed.

If the load moment is reduced to permitted load limits again, the HDL-system will increase the oil flow to normal and the working speed will increase again. However, the automatic disconnection implies that all control levers have been into neutral position at the same time as the load moment has been reduced to the permitted load limit.

Please also see chapter on “Heavy Duty Lifting, HDL” in the manual: Instruction Manual - RCL Safety System.

14. Hoses and Hydraulic Pipes
The hoses must comply with the SAE R100 2AT standard.

The pipes are manufactured in St.35.4C-NBK.
